

# Xtraction

IT organizations everywhere struggle to measure and communicate metrics around the value they bring to the business. IT performance and productivity reporting alone doesn't reveal how IT supports business-critical initiatives. Xtraction lets IT and non-technical staff create and view interactive reports and dashboards, easily pulling from multiple data sources without coding. Gain a consolidated business view of all types of data instantly and visualize the state of your IT environment for better-informed decisions.

## Access Fast, User-Centric Reporting

Immediate access to performance data—combined with meaningful business values such as financial impact data—reduces time to action. Because Xtraction targets a user's role, anyone can create reports or business dashboards specific to their role or target audience in minutes. The solution reduces dependency on specialized staff and increases user productivity. Xtraction alerting sends you a dashboard of information automatically when something occurs that you need to know about.

## Intuitive Interface

An easy-to-use interface enables anyone to create reports by drag-and-drop or point-and-click actions. Users simply select a data source and the desired output format for a dashboard view that suits the intended audience, and Xtraction does the rest. Available on iPads and web browsers so you can provide up-to-the minute data—anywhere, anytime.

## Connect Data Silos

The solution goes beyond simple one-source data import. Unify and cross-reference data from service management, asset management, client management, and other data sources in a single view to provide a level of analysis not available from standard IT reports.

## Visualize Data Your Way

Monitor critical information in real-time through an auto-refresh function. Alternatively, visualize point-in-time data on dashboards in various formats such as pie, bar, or line charts, or export to popular file formats. Schedule report delivery times that suit you.

## Drill Down for Detail

Xtraction doesn't stop at flat dashboard views. Users can drill down and filter results to focus on points of interest or areas of concern. Alternatively, with the right access, they can open a record in the underlying application.

## Data Access without Risk

Role-based access ensures you maintain secure control over who sees your business data. Xtraction includes integrated authentication with Active Directory for secure access that doesn't impact user productivity.

## Rapid Implementation Using Pre-defined Data Sources

We've done the heavy lifting so you don't have to. More than 50 pre-defined data models are available for enterprise applications as well as popular relational databases. Contact us for a complete list.
