

Ivanti® Unified Endpoint Management

Your organization’s employees carry more than one device, but using more than one system to manage them is no way to scale your IT resources. With Ivanti you gain the total picture of all the devices your users carry in a single management experience. With everything visible in one unified system you can ensure comprehensive, consistent compliance while granting users the access they need from their preferred device.

Manage Users, Not Just Their Devices

Unified endpoint management must manage comprehensively the various operating systems being carried into your corporate environment. Put an end to the complexities of a separate enterprise mobility management system. Simplify and secure enterprise mobility alongside your users’ other endpoints. Apply policies and actions, or provide assets or services to the user. Let the intelligence of the system determine which devices get what. No one else can do this like Ivanti, because they don’t offer the underlying management integration of all the systems users carry—Windows, Macs, Linux, Unix, iOS, and Android.

Ensure Consistent User Access

When you can see all the endpoints a user carries, you can ensure their access privileges are consistent—regardless of the device they’re using at the moment. Your users can get work done more easily anytime, on any device, and your IT administrators can configure everything in a single console. Volume app deployments, mass enrollment, and MDM-style management across device platforms and operating systems help simplify IT management and ensure consistency across users devices.

Integration, Not Just Compatibility

Many IT software solutions vendors claim to “work with” or be “compatible with” other systems to provide endpoint management, only to point fingers when something goes wrong. Ivanti® Endpoint Manager, powered by Landesk, provides truly integrated Unified Endpoint Management. No need to worry about multiple vendors’ systems or compatibility issues.

Common User Experiences across Devices

Your users not only expect access to content to be consistent across their devices, they want a common user experience. With Ivanti® Workspaces that are designed for different roles, users experience content in a

modern, consistent format across their devices. User familiarity engenders satisfaction, and reduces the number of inbound support calls caused by inconsistent, unintuitive user experiences. Plus, you make it easy for new employees to gain needed access to the devices they will carry so they can be productive their very first day.

Universally Resolve Users' Support Issues

Elevate the level of service your IT administrators provide. When a user needs support, you can ensure the resolution covers all the devices they carry. You'll eliminate repeat calls for resolution across a user's devices and heighten the value users realize from increased service quality.

Install On-Premise, in the Cloud, or as a Managed Service

Where some vendors provide only one delivery model, Ivanti gives you the same unified endpoint management functionality and benefits either on-premise or in the cloud. When in the cloud, choose to either use your own administrative resources or leverage Ivanti's expertise to handle your core management needs, leaving your team to focus on other business-focused projects. It's worth a look from both a budgeting and cloud strategy standpoint.

Gain visibility and manage all the devices your users carry with a single management experience.
