Key Feature: User Personalization

On-demand personalization eliminates typical problems associated with roaming profiles including slow logon times due to profile bloat, and loss of personal settings and help-desk calls due to profile corruption.

Stream personal settings as required, at application start or stop, to alleviate the burden on the logon process and provide rapid logon times.

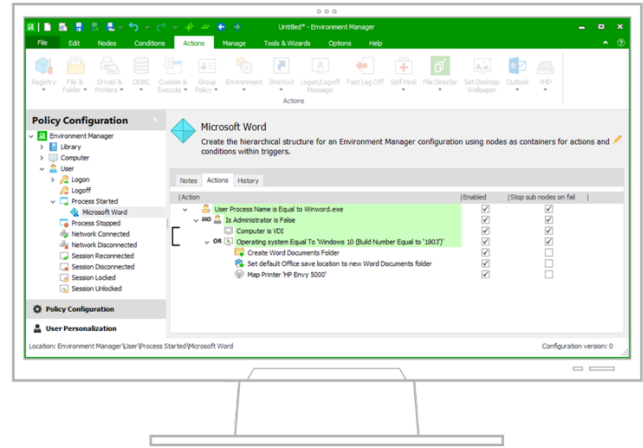

Roll back personal settings on a per-application basis to reduce profile-related support calls and eliminate user downtime. Bulk updates on centrally-stored profile data equip IT with new problem-solving capabilities and ease the process of rolling out network changes to user sessions.

Key Feature: Desktop Configuration

The multi-threaded logon engine in User Workspace Manager replaces slow and complex logon scripts and GPO settings with context-aware actions that can be applied simultaneously at logon, rather than one-after-the-other.

Desktop configuration items typically configured to apply at logon can alternatively be set up to occur throughout the

user session, on-demand, to reduce the burden on the logon process. This provides even quicker logon times and a much-improved user experience.

Key Feature: File Sync and Migration

The granular sync mechanism in User Workspace Manager allows users’ files to be synced to on-premises or cloud-based storage from anywhere within their user profile—either in the background, on-demand, or in real-time—to provide effortless migration of users’ files and eliminate the issue of data sprawl where user files are saved across different devices.

What’s more, migrating user files from on-premises storage to the cloud also means you reap the benefits of the 1TB of free OneDrive for Business storage per user with every license of Office 365.
