

Avalanche: Managing the Android Supply Chain

After two decades of Windows Mobile and Windows CE, Avalanche continues to be your trusted MDM for new Android devices. Our latest release delivers powerful enhancements - ready for your new deployments.

Android Enterprise for Your Mobile Computers

Most supply chain mobility deployments depend on full device management capabilities. Avalanche continues to deliver, with Android Enterprise-validated Full Device Management mode support.

Android Kiosk Mode

Dedicated Device mode for Android Enterprise secures and locks down kiosk-use devices into the single app you want to share. Block access to settings, escapes and more.

Scan to Enroll

We continue to deliver options that make it easier for administrators to configure and deploy mobility throughout your business.

More app and settings security

Improvements for application whitelisting help maintain control of what's running on your devices, while WiFi configuration management ensures workers stay connected. Administrators can also set protections to prevent device resets to factory parameters.

Share your ideas

We've added the UserVoice tool into Avalanche. This utility makes it easy for Avalanche users to make feature suggestions and offer feedback on Avalanche directly to our development teams.
