

# ACCELERATE

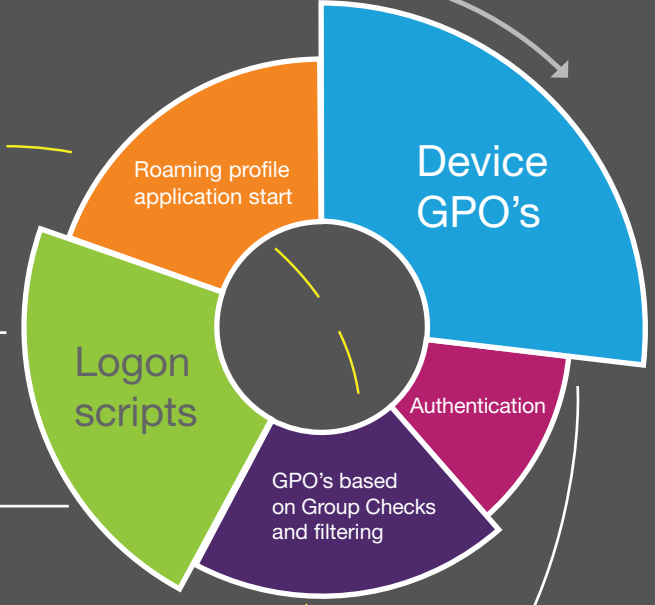

## Logon Times

Logging on to a PC or virtual desktop is the first thing your users do every day. It sets the tone for your business – perhaps more than you even realize.

There are many different factors that contribute to poor logon times. Fortunately, we've seen them all, and we can help you reduce them.

Anatomy of a logon:

# 99%

REDUCTION  
in logon times

“Our pilot with Ivanti demonstrated that we reduced logon times from seven minutes to six seconds. That is a 99% reduction! It was so astounding that we stopped the pilot immediately and rolled it out across the board.”

DOES YOUR LOGON AUTOMATION STRATEGY LOOK LIKE THIS?

Instead of building a monolithic profile for each user, which degrades logon times and introduces corruption risks, Ivanti captures and manages user personalization elements individually at the most granular level possible.

Ivanti applies user personalization to the desktop and applications on a just-in-time basis.

Replace your inefficient logon scripts and cumbersome collection of group policy objects with point-and-click simplicity and the power of contextual awareness.

Ivanti actively monitors each user's computing conditions and dynamically adapts the configuration of the desktop-based policies you define. This includes the basics like printer and drive mapping, as well as more sophisticated user workflows.

Your users' desktops and applications will “just work” as they move between locations or across different devices.

FAST LOGON TIMES ARE JUST THE BEGINNING

- ELIMINATE Profile Corruption
- SIMPLIFY User Data Management
- INCREASE User Density
- SECURE Your Desktop
- IMPROVE Desktop Responsiveness
- SIMPLIFY Image Management
