

# Enterprise Mobility Management

Mobile devices enter your organization virtually every day – and that’s a good thing. The productivity gains that workers can achieve through anytime, anywhere access accelerate decision-making and response to business activities. Ivanti Endpoint Manager lets you embrace mobility with the confidence that security measures are available to protect corporate information consistently across endpoints.

## Support Mobile Users Effectively

Ivanti® Endpoint Manager features integrated Enterprise Mobility Management capabilities to efficiently manage and secure the mobile devices in your environment. These capabilities include Mobile Application Management, Mobile Device Management, Mobile Security Management, and end-to-end, true Unified Endpoint Management for all your devices.

### Mobile Device Management

Simplify inventory, configuration, and management of your mobile devices. Easily create profiles, enforce restrictions, and set and enforce security policies. Enrolling devices is quick and easy, with full support for Apple’s Device Enrollment Program (DEP). Best of all, DEP can be used across macOS, iOS, and tvOS devices.

### Mobile Application Management

Push applications to users’ devices and control access to documents and other content. You can also blacklist or whitelist applications and set rules for URL access. Wipe corporate applications selectively to maintain security in the event a device is lost or stolen. Administrators can manage both in-house enterprise apps or third-party apps from stores such as iTunes or Google Play. Apps can be installed and removed based on Smart Policies targeting users by role, location, device type, or other criteria as needed. Apps can also be published to a self-service portal, configured remotely, and managed via Apple Volume Purchase Program (VPP).

## Mobile Security Management

Maintaining security on mobile devices means detecting jailbroken or rooted devices, enforcing password standards and other configurations, and controlling device access to company networks and data.

Maintain control of Android devices with Android Enterprise, including a robust list of Android restrictions such as camera, screen capture, and app uninstall, among others. Couple with compliance settings for both Android and iOS devices, and you can feel confident that mobile users are working within company policies.

### Manage BYOD Alongside Corporate-owned Endpoints

It shouldn’t matter who owns the hardware; BYOD, CYOD, and COPE devices need to have the apps, configurations, and data that enable users to be productive on their mobile devices.

Corporate-managed devices are expected to have Enterprise Mobility Management features such as device enrollment, policy deployment, and remote device locking. Make your BYOD policies more successful by striking a balance with users of personal devices. Safeguard corporate information without invading the user’s personal mobile-device space.

## MDM for Mac and Windows 10

Is MDM-style endpoint management more your cup of tea? You're covered! With Mac MDM and Windows 10 MDM capabilities, you can extend your mobility management experience to your users' laptops and more.

## True Unified Endpoint Management

As operating systems like macOS, iOS, and Windows 10 "flatten," Unified Endpoint Management of mobile and client endpoints is increasingly the only way to support users. Ivanti Endpoint Manager provides fully integrated Enterprise Mobility Management so IT teams can use a single system to manage all the devices users carry. Uniform delivery of policies is made easy and zero-touch employee onboarding becomes a reality. You can administer policies once and propagate them across all the user's devices, ensuring consistent security for IT teams and uniform user access across devices.

## Provide a Common Experience Across Devices

Role-based Workspaces provide users a secure place to access needed applications and corporate information. Your IT team can deliver a corporate app store experience, all through an interface and navigation experience that is consistent from the desktop to the tablet or smartphone.
